Final Project — Evaluation Criteria

Live demo + code review · Week 13

Criterion	Pts	Evaluation Focus (for live demo + code review)
1. ER Diagram & Database Schema	6	ERD includes ≥5 entities & ≥3 relationships; correct PK/FK usage; schema implemented in MySQL matches ERD. Demonstrated understanding of relationships in queries.
2. CRUD Functionality (Core Operations)	7	Application (web/desktop) performs Create, Read, Update, Delete correctly for key entities. Demonstrated via UI. Data changes reflect instantly in MySQL. Includes validation/error handling.
3. User Interface & Navigation	3	Functional and organized interface with ≥2 pages; clear navigation flow; usability in demo; basic styling (HTML/CSS or equivalent).
4. Access Control & Roles	4	At least 3 roles (Developer/Admin/User) demonstrated. Each role shows distinct privileges and restricted actions. Access logic verified through demo (e.g., admin can edit, user read-only).
5. Database Security Implementation	4	Proper parameterized queries throughout (no SQL injection); database credentials not hardcoded (e.g., kept in a .env file); generic error messages that do not leak database details. Shown in code inspection or demo. **Optional:** hashing sensitive information (e.g., passwords with bcrypt or SHA-256). Not required for full marks — see the Password Hashing handout. If implemented, explain it in the demo.
6. Advanced SQL Features (Trigger & Stored Procedure)	3	At least one stored procedure and one trigger, relevant and functional (e.g., audit logging, auto updates). Shown via query execution or demo scenario.
7. Individual Understanding & Professionalism	3	Each team member can explain their/team's codes and logic during Q&A. Clear presentation, confidence, teamwork reflected in responses.
Total	30	

Updated: password hashing (Criterion 5) is now optional. The 4 Database Security points are earned through parameterized queries, credentials kept out of the code, and safe error handling.
